

Service Management Services

Managing Technology Has Never Been More Complex

Managing IT operations has become a very complex business. For most companies, managing the growing number of new and legacy technologies, networking and computing components, personal computers, and appliances has become overwhelming. Often, this complexity results in frequent service disruptions, delays, and unsatisfied users because IT departments cannot proactively manage the requirements of the enterprise. Technology is evolving, but shrinking IT budgets, unpredictable legacy equipment, lack of standardization, loosely integrated systems resulting from mergers and acquisitions, and not to mention increased scrutiny and expectations from business leaders, is forcing IT organizations to find proven methods to improve quality while controlling costs.

Service Management Aligns Technology Operations with Business Needs

Perot Systems Service Management Services help customers ensure their IT organizations are aligned to meet the needs of the business. After all, the job of IT is to support the operations and growth of the business. Perot Systems' long history of managing IT operations for many of the world's largest companies has led to the development of a proven service management solution which has helped our customers realize the true benefits of their IT infrastructure.

Developing, Implementing, and Supporting the Plan Ensures Success

To help customers identify and establish an effective management system based on their business requirements, Perot Systems first conducts an assessment. Our teams work closely with key business and IT stakeholders to understand business drivers. This allows us to get an accurate accounting of the current state of operations and the expectations of business leaders to develop a roadmap to improve service and alignment with the business.

The solution typically contains initiatives such as process re-engineering, organizational alignment and optimization, service management tool implementation, and leadership and skills improvements. Our solutions include the implementation and operational support of Perot Systems-developed operational processes. Based on the Information Technology Infrastructure Library (ITIL) standard, these processes embody our best practices, developed for multiple accounts across multiple industries.

Organizational alignment and accountability with these processes is then achieved by implementing our proprietary service management tool, OPAS (Operational Process Applications Suite). Developed specifically to support service management processes for large and/or complex IT organizations, OPAS provides incident, problem, change, request, and configuration management across the spectrum of IT operational areas such as server support, operations, security and administration, network support, and disaster recovery.

IT organizations face many obstacles ensuring operations and costs are aligned with the needs of the organization. Perot Systems Service Management Services use proven methodologies, best practices, and proprietary management tools to provide IT organizations with a formalized management process to assess the effectiveness of their operations. Our Service Management Services ensure alignment with the business strategy and provide a sustainable roadmap for ongoing operations and cost containment.

PEROT SYSTEMS® Service Management Services include:
